1 Introduction Bicycle Dynamics

Bicycle and motorcycle dynamics is the science of the motion of bicycles and motorcycles and their components, due to the forces acting on them. Dynamics falls under a branch of physics known as classical mechanics. Bike motions of interest include balancing, steering, braking, accelerating, suspension activation, and vibration. The study of these motions began in the late 19th century and continues today.

Start with the 24 degrees of freedom of the 4 rigid bodies, each with 3 translational and 3 rotational degrees of freedom in physical space (4 x (3 + 3) = 24). Then subtract out 5 degrees of freedom for each of the three hinges and one more for each wheel touching the ground plane: 24 \u2013 3 x 5 \u2013 2 = 7.

1. Introduction The problem of bicycle stability has been analysed many times at different levels of mathematical skill. At the turn of the century, Whipple [1] and Klein and Sommerfeld [2] obtained self-stabilising characteris- ties depending on speed: there is a stable region between 4 and 5.5ms⁻¹. The following simplifica-

An advanced model of bicycle dynamics

Over the past 140 years, scores of other people have studied bicycle dynamics, either for a dissertation, a hobby or sometimes as part of a life's work on vehicles. This sparse and varied research on the dynamics of bicycles modelled as linked rigid bodies was initially reviewed in Hand (1988).

1. Introduction. Increasing urban bicycling as a transport mode in cities has established net benefits for human health across a range of social, physical and mental outcomes (de Hartog et al., 2010, Woodcock et al., 2013, Woodcock et al., 2009, Lindsay et al., 2011, Macmillan et al., 2014). These include increasing physical activity, enhanced neighbourhood social connection and fairer, low-cost access to health promoting education, employment, goods and services.
