Very roughly speaking, a subriemannian geometry consists of a manifold endowed with a distribution (meaning a k -plane field, or subbundle of the tangent bundle), called horizontal together with an inner product on that distribution. If $k=n$, the dimension of the manifold, we get the usual Riemannian geometry.

Subriemannian geometries, also known as Carnot-Carath é odory geometries, can be viewed as limits of Riemannian geometries. They also arise in physical phenomenon involving “ geometric phases ” or holonomy. Very roughly speaking, a subriemannian geometry consists of a manifold endowed with a distribution (meaning a k -plane field, or subbundle of the tangent bundle), called horizontal together with an inner product on ...
