Via the Web. In manufacturing, new communication technologies have ushered in a new era for the team-based product development strategy of concurrent engineering. Known as collaborative engineering, the new phase makes it unnecessary for team members to be in the same room. seated around the same table. The team members can be scattered around the facility, around the city, around the country, and even around the world, and can still contribute their valuable input. More complex than traditional concurrent engineering, collaborative engineering not only deals with collaboration itself, but also the infrastructure and environments that enable and nurture it. Going far beyond describing the use of the internet, Anthony Mills thoroughly examines the principles, applications and various tools relevant to this new age of industrial communications. He explains how an organization can use them effectively in welding together personnel and suppliers - no matter how far flung - so that they can play major roles in the organization's success.

Written for the practicing electronics professional, Tolerance Analysis of Electronic Circuits Using MATLAB offers a comprehensive, step-by-step treatment of methods used to perform analyses essential to the design process of circuit cards and systems of cards, including: worst-case analysis, limits for production testing, component stress analysis, determining if a design meets specification limits, and manufacturing yield analysis

Theory and practice of tolerances are very important for designing and manufacturing engineering artifacts on a rational basis. Tolerance specifies a degree of "discrepancy" between an idealized object and its physical realization. Such discrepancy inevitably comes into our product realization processes because of practical cost consideration or our inability to fully control manufacturing processes. Major product and production characteristics which are affected by tolerances are product quality and cost. For achieving high precision machines tight tolerance specification is necessary, but this will normally increase product cost. In order to optimally compromise the conflicting requirements of quality and cost, it is essential to take into account of the total product life cycle throughout product planning, design, manufacturing, maintenance and recycling. For example, in order to construct durable products under severe working conditions, low sensitivity of product functionality with respect to tolerances is required. In future, re-use of components or parts will become important, and tolerance synthesis with respect to this aspect will be an interesting future research topics.
