American hero and explorer Admiral Richard E. Byrd, Jr. tells the story of his first journey through Antarctica and the founding of a series of camps and bases referred to as "Little America." Over the years, many similar areas were developed as camps and research areas on Byrd's Antarctic

missions, but the founding of "Little America" required great courage and leadership. In awe of the unforgiving landscape, he eagerly met its treacherous challenges. Byrd outlines the blueprint for his first mission to Antarctica and provides a glimpse into the obstacles he and his team overcame at the world's end. Reissued for today's readers, Admiral Byrd's classic explorations by land, air, and sea transport us to the farthest reaches of the globe. As companions on Byrd's journeys, modern audiences experience the polar landscape through Byrd's own struggles, doubts, revelations, and triumphs and share the excitement of these timeless adventures.

This volume of the acclaimed Methods in Cell Biology series provides specific examples of applications of confocal microscopy to cell biological problems. It is an essential guide for students and scientists in cell biology, neuroscience, and many other areas of biological and biomedical research, as well as research directors and technical staff of microscopy and imaging facilities. An integrated and up-to-date coverage on the many various techniques and uses of the confocal microscope (CM). Includes detailed protocols accessible to new users Details how to set up and run a "Confocal Microscope Core Facility" Contains over 170 figures

The purpose of this series of volumes is to present a comprehensive view of the complications that result from the use of acceptable diagnostic and therapeutic procedures. Individual volumes will deal with iatrogenic complications involving (1) the alimentary system, (2) the urinary system, (3) the respiratory and cardiac systems, (4) the skeletal system and (5) the pediatric patient. The term iatrogenic, derived

from two Greek words, means physician-induced. Originally, it applied only to psychiatric disorders generated in the patient by autosuggestion, based on misinterpretation of the doctor's attitude and comments. As clinically used, it now pertains to the inadvertent side-effects and complications created in the course of diagnosis and treatment. The classic categories of disease have included: (1) congenital and developmental, (2) traumatic, (3) infectious and inflammatory, (4) metabolic, (5) neoplastic, and (6) degenerative. To these must be added, however, iatrogenic disorders—a major, although generally unacknowledged, source of illness. While great advances in medical care in both diagnosis and therapy have been accomplished in the past few decades, many are at times associated with certain side-effects and risks which may result in distress equal to or greater than the basic condition. Iatrogenic complications, which may be referred to as "diseases of medical progress," have become a new dimension in the causation of human disease.

Over the past 25 years, the world's population has witnessed an explosion in knowledge about infectious diseases. The global population is coming to the realization that diseases long recognized to cause substantial suffering, such as malaria, tuberculosis, schistosomiasis, and hepatitis, can be diagnosed and treated, and that transmission can be prevented using tools that are available, and which may be becoming increasingly affordable. The global population is recognizing that few infections are local: the travel of humans, other animals, insects, and food transport pathogens around the world, often with astonishing rapidity. New pathogens are appearing, either newly recognized or newly developing, such as severe acute respiratory syndrome (SARS), avian influenza, metapneumovirus, or hepatitis C, which are causing human morbidity and mortality. Finally, there is growing fear

that dangerous pathogens may be intentionally introduced into human populations by deranged individuals or terrorist organizations. The potential to use drugs or biologic agents to treat and prevent infectious diseases has increased dramatically over the past quarter century as we have learned more about the biology of many of these agents, and as we have developed techniques to discover new agents by high throughput screening programs and by sophisticated drug design and synthesis.

This volume addresses what is currently known about the use of ApoE genotyping in diagnosing and predicting Alzheimer's disease. Because ApoE genetic testing has such far-reaching consequences, this volume will be of use not only to those in the medical and scientific community involved in the care of patients with Alzheimer's disease, but also to those concerned with the ethical, legal, epidemiological and public health policy issues as well. A summary will also be included of the results of working groups defining the issues, asking methodological questions, and discussing issues concerning genetic counselling and research-related questions.

Together with "Critical Notes on Virgil" (De Gruyter 2016), this volume offers an enlightening complement to the critical text of the Georgics and the Aeneid recently published in the Bibliotheca Teubneriana. In "Virgilian Parerga: Textual Criticism and Stylistic Analysis" can be seen the progress owed to the insight of four of the finest scholars of the past (Heinsius, Heyne, Ribbeck and Sabbadini). The first chapters trace the steps of the arduous path that from the middle of the 17th century on led these outstanding erudites to free themselves from the uulgata and compose a new critical text

for the works of Virgil. The later chapters tackle important questions of textual criticism and Virgilian style, and propose new answers to inveterate exegetic problems. The volume ends with an interesting theoretical discussion on the methodological principles that combine the rules of philology with those of law. Here the author questions the logical assumptions that dominate not only the philological process but also the judicial one.
